

Assignment 10: Data Scraping

Tallulah Bowden

OVERVIEW

This exercise accompanies the lessons in Environmental Data Analytics on data scraping.

Directions

1. Rename this file `<FirstLast>_A10_DataScraping.Rmd` (replacing `<FirstLast>` with your first and last name).
2. Change “Student Name” on line 3 (above) with your name.
3. Work through the steps, **creating code and output** that fulfill each instruction.
4. Be sure your code is tidy; use line breaks to ensure your code fits in the knitted output.
5. Be sure to **answer the questions** in this assignment document.
6. When you have completed the assignment, **Knit** the text and code into a single PDF file.

Set up

1. Set up your session:
 - Load the packages `tidyverse`, `rvest`, and any others you end up using.
 - Check your working directory

```
#1
library(tidyverse)
library(here)
library(rvest)
library(lubridate)
library(viridis)

getwd()
```

```
## [1] "/home/guest/Environmental Data Exploration/EDE_Fall2025"
```

```
here()
```

```
## [1] "/home/guest/Environmental Data Exploration/EDE_Fall2025"
```

2. We will be scraping data from the NC DEQs Local Water Supply Planning website, specifically the Durham’s 2024 Municipal Local Water Supply Plan (LWSP):
 - Navigate to <https://www.ncwater.org/WUDC/app/LWSP/search.php>

- Scroll down and select the LWSP link next to Durham Municipality.
- Note the web address: `https://www.ncwater.org/WUDC/app/LWSP/report.php?pwsid=03-32-010&year=2024`

Indicate this website as the as the URL to be scraped. (In other words, read the contents into an `rvest` webpage object.)

```
#2
website <- read_html("https://www.ncwater.org/WUDC/app/LWSP/report.php?pwsid=03-32-010&year=2024")
```

3. The data we want to collect are listed below:

- From the “1. System Information” section:
 - Water system name
 - PWSID
 - Ownership
- From the “3. Water Supply Sources” section:
 - Maximum Day Use (MGD) - for each month

In the code chunk below scrape these values, assigning them to four separate variables.

HINT: The first value should be “Durham”, the second “03-32-010”, the third “Municipality”, and the last should be a vector of 12 numeric values (represented as strings)“.

```
#3
system_name <- website %>%
  html_nodes("div+ table tr:nth-child(1) td:nth-child(2)") %>%
  html_text()

PWSID <- website %>%
  html_nodes("td tr:nth-child(1) td:nth-child(5)") %>%
  html_text()

ownership <- website %>%
  html_nodes("div+ table tr:nth-child(2) td:nth-child(4)") %>%
  html_text()

max_day_use <- website %>%
  html_nodes("th~ td+ td") %>%
  html_text()
```

4. Convert your scraped data into a dataframe. This dataframe should have a column for each of the 4 variables scraped and a row for the month corresponding to the withdrawal data. Also add a Date column that includes your month and year in data format. (Feel free to add a Year column too, if you wish.)

TIP: Use `rep()` to repeat a value when creating a dataframe.

NOTE: It's likely you won't be able to scrape the monthly withdrawal data in chronological order. You can overcome this by creating a month column manually assigning values in the order the data are scraped: "Jan", "May", "Sept", "Feb", etc...

5. Create a line plot of the maximum daily withdrawals across the months for 2024, making sure, the months are presented in proper sequence.

```
#4
month <- c("Jan", "May", "Sept",
           "Feb", "Jun", "Oct",
           "Mar", "Jul", "Nov",
           "Apr", "Aug", "Dec")

year <- 2024

df_water <- data.frame("System Name" = rep(as.factor(system_name)),
                       "PWSID" = rep(as.factor(PWSID)),
                       "Ownership" = rep(as.factor(ownership)),
                       "Maximum Day Use (MGD)" = as.numeric(max_day_use),
                       "Month" = month,
                       "Year" = rep(year),
                       "Date" = my(paste(month, "-", year)))

#5
ggplot(df_water, aes(x=Date, y=Maximum.Day.Use..MGD.)) +
  geom_line() +
  labs(title = paste("2024 Maximum Day Use (MGD) for", df_water$System.Name),
       y="Maximum Day Use (MGD)",
       x="Date")
```

2024 Maximum Day Use (MGD) for Durham

6. Note that the PWSID and the year appear in the web address for the page we scraped. Construct a function with two inputs - “PWSID” and “year” - that:

- Creates a URL pointing to the LWSP for that PWSID for the given year
- Creates a website object and scrapes the data from that object (just as you did above)
- Constructs a dataframe from the scraped data, mostly as you did above, but includes the PWSID and year provided as function inputs in the dataframe.
- Returns the dataframe as the function’s output

```
#6.
scrape.it <- function(PWSID, year){

the_website <- read_html(paste0('https://www.ncwater.org/WUDC/app/LWSP/report.php?psid=', PWSID, '&year=', year))

system_name <- the_website %>%
  html_nodes("div+ table tr:nth-child(1) td:nth-child(2)") %>%
  html_text()

ownership <- the_website %>%
  html_nodes("div+ table tr:nth-child(2) td:nth-child(4)") %>%
  html_text()

max_day_use <- the_website %>%
  html_nodes("th~ td+ td") %>%
```

```

html_text()

df_water <- data.frame("System Name" = rep(as.factor(system_name)),
                      "PWSID" = rep(as.factor(PWSID)),
                      "Ownership" = rep(as.factor(ownership)),
                      "Maximum Day Use (MGD)" = as.numeric(max_day_use),
                      "Month" = c(1,5,9,2,6,10,3,7,11,4,8,12),
                      "Year" = rep(year),
                      "Date" = my(paste(month,"-",year)))

Sys.sleep(1)

return(df_water)
}

```

7. Use the function above to extract and plot max daily withdrawals for Durham (PWSID='03-32-010') for each month in 2020. Then show the structure of the dataframe with either the `str()` or the `glimpse()` function.

```

#7
the_df <- scrape.it('03-32-010', 2020)

glimpse(the_df)

```

```

## Rows: 12
## Columns: 7
## $ System.Name      <fct> Durham, Durham, Durham, Durham, Durham, Durham, ~
## $ PWSID            <fct> 03-32-010, 03-32-010, 03-32-010, 03-32-010, 03-3~
## $ Ownership        <fct> Municipality, Municipality, Municipality, Munici~
## $ Maximum.Day.Use..MGD. <dbl> 36.01, 36.98, 41.69, 32.05, 40.61, 40.56, 37.29,~
## $ Month            <dbl> 1, 5, 9, 2, 6, 10, 3, 7, 11, 4, 8, 12
## $ Year             <dbl> 2020, 2020, 2020, 2020, 2020, 2020, 2020, 2020, ~
## $ Date             <date> 2020-01-01, 2020-05-01, 2020-09-01, 2020-02-01, ~

```

```

ggplot(the_df, aes(x=Date, y=Maximum.Day.Use..MGD.)) +
  geom_line() +
  labs(title = paste(the_df$Year, "Maximum Day Use (MGD) for", the_df$System.Name),
       y="Maximum Day Use (MGD)",
       x="Date")

```

2020 Maximum Day Use (MGD) for Durham

- Use the function above to extract data for Cary (PWSID = '03-92-020') in 2020. Combine this data with the Durham data collected above and create a plot that compares Cary's to Durham's water withdrawals.

```
#8
the_df2 <- scrape.it('03-92-020', 2020)

the_dfs <- bind_rows(the_df, the_df2)

ggplot(the_dfs, aes(x=Date, y=Maximum.Day.Use..MGD., color=System.Name)) +
  geom_line() +
  labs(title = paste(the_dfs$Year, "Maximum Day Use (MGD)"),
       y="Maximum Day Use (MGD)",
       x="Date",
       color="System Name")
```

9. Use the code & function you created above to plot Cary’s max daily withdrawal by months for the years 2018 thru 2023. Add a smoothed line to the plot (method = ‘loess’).

TIP: See Section 3.2 in the “10_Data_Scraping.Rmd” where we apply “map2()” to iteratively run a function over two inputs. Pipe the output of the map2() function to bind_rows() to combine the dataframes into a single one, and use that to construct your plot.

```
#9
years <- c(2018,2019,2020,2021,2022,2023)
cary_years_separate <- map2('03-92-020', years, scrape.it)
cary_years_combined <- bind_rows(cary_years_separate)

ggplot(cary_years_combined, aes(x=Date, y=Maximum.Day.Use..MGD.)) +
  geom_smooth(method = "loess", se=F) +
  labs(title = paste("Maximum Day Use (MGD) for", cary_years_combined$System.Name, "Over Time"),
       y="Maximum Day Use (MGD)",
       x="Date",
       color="System Name")
```

Question: Just by looking at the plot (i.e. not running statistics), does Cary have a trend in water usage over time?

Answer: Cary does have a trend in water usage over time. Cary is using more water over time, with a plateau in water usage from 2020 to 2021. This could be the result of the pandemic but further analysis is needed to understand this plateau in water usage. There seems to be a leveling in water usage from late 2022 to 2024. Generally, more water is being used over time.
